SLTEC PRESS RELEASE

## Innovative Technology Enable On Farm Delivery of Bulk Fertilizer (July 06) ROAD TANKER CUSTOMISED TO DELIVER LIQUID FERTILIZERS

A 26 tonne bulk liquid road tanker has been customized with new liquid fertilizer metering technology to supply farmers in Northern Victoria & Southern NSW.

Jamie McMaster, Marketing & Technology Director of Sustainable Liquid Technology (SLTEC) said "this new tanker is a first for the liquid fertilizer industry". We can now dispatch bulk liquids in part compartment loads and ticket the exact discharge via a dispatch advice on farm in a manner compliant with Weights and Measures approvals.

Before we employed this new technology fertilizer was either delivered in full tanker loads or after dispatch the tanker had to go over the weighbridge for a second time to tare off.

Developing and customizing our delivery system has been a significant challenge requiring substantial investment and some extensive research and development said Mr McMaster.

Mr McMaster said the benefits of this delivery system to farmers will involve on farm storage tanks to be filled or topped up by SLTEC through the growing season and the exact amount discharged can be invoiced, saving time and removing errors.

This deliver system is another first for SLTEC and will assist us in providing rapid delivery of fertilizer to farms throughout the coming growing season said Mr McMaster.
